

Finite Elements: examples 2

Colin Cotter

April 12, 2017

1. Consider the variational problem with bilinear form

$$a(u, v) = \int_0^1 (u'v' + u'v + uv) \, dx,$$

corresponding to the differential equation

$$-u'' + u' + u = f.$$

Prove that $a(\cdot, \cdot)$ is continuous and coercive on a C^0 finite element space V defined on $[0, 1]$, equipped with the H^1 inner product.

Solution: *For continuity,*

$$\begin{aligned} |a(u, v)| &\leq |(u, v)_{H^1}| + \left| \int_0^1 u'v \, dx \right| \\ &\leq \|u\|_{H^1} \|v\|_{H^1} + \|u'\|_{L^2} \|v\|_{L^2}, \\ &\leq 2\|u\|_{H^1} \|v\|_{H^1}. \end{aligned}$$

For coercivity,

$$\begin{aligned} a(v, v) &= \int_0^1 (v')^2 + v'v + v^2 \, dx, \\ &= \frac{1}{2} \int_0^1 (v' + v)^2 \, dx + \frac{1}{2} \int_0^1 (v')^2 + v^2 \, dx, \\ &\geq \frac{1}{2} \|v\|_{H^1}^2. \end{aligned}$$

2. For the differential equation $-u'' + ku' + u = f$, formulate a C^0 finite element discretisation with bilinear form $a(u, v)$. Find a value for k such that $a(v, v) = 0$ but $v \neq 0$ for some $v \in V$.

Solution: *The bilinear form is*

$$a(u, v) = \int_0^1 u'v' + ku'v + uv \, dx.$$

We need to find a function for which the $\int kv'v \, dx$ is sufficiently negative to cancel out the other two positive terms. For example, if $v = (x - 1)$, which is in all C^0 finite element spaces on $[0, 1]$, then $v' = 1$, and

$$a(v, v) = \int_0^1 1 + k(x - 1) + (1 - x)^2 \, dx = 1 - k/2 + 1/3 = 0,$$

if $k = 2 + 2/3$.

3. Let $a(\cdot, \cdot)$ be the inner product for a finite element space U . For $F \in U'$, show that the following two statements are equivalent:

- (a) $u \in U$ satisfies $a(u, v) = F(v) \, \forall v \in U$.
- (b) u uniquely minimises $\frac{1}{2}a(v, v) - F(v)$ over $v \in U$.

Use this to conclude that the Poisson and Helmholtz finite element discretisations can be formulated as minimisation problems. .

Solution: Assume that u solves problem (a) above. Define

$$J(v) = \frac{1}{2}a(v, v) - l(v).$$

Then

$$\begin{aligned} J(v) - J(u) &= \frac{1}{2}a(v, v) - l(v) - \frac{1}{2}a(u, u) + l(u), \\ &= \frac{1}{2}a(v, v) - \frac{1}{2}a(u, u) - l(v - u), \end{aligned}$$

using linearity of l . Since u is a solution, we have $l(v - u) = a(u, v - u)$, and hence

$$\begin{aligned} J(v) - J(u) &= \frac{1}{2}a(v, v) - \frac{1}{2}a(u, u) - a(u, v - u), \\ &= \frac{1}{2}(a(v, v) - 2a(u, v) + a(u, u)), \\ &= \frac{1}{2}a(v - u, v - u), \\ &= \|v - u\|_U^2 \geq 0, \end{aligned}$$

using the bilinearity of $a(\cdot, \cdot)$ and the definition of $\|\cdot\|_U$ from $a(\cdot, \cdot)$. Hence, $J(v) \geq J(u)$ for all $v \in U$. This means that u is a minimiser of J over U . To check that u is the unique minimiser, assume the converse, so that \tilde{u} also minimises J . Then, $J(v) \geq J(\tilde{u})$ for all $v \in U$. In particular, $J(u) \geq J(\tilde{u})$. Since u is a minimiser, we also have that $J(\tilde{u}) \geq J(u)$. Hence, $J(u) = J(\tilde{u})$. From the calculation above,

$$0 = J(u) - J(\tilde{u}) = \frac{1}{2}\|u - \tilde{u}\|_U^2 \implies u = \tilde{u}.$$

On the other hand, let u be a minimiser of problem (b). Then,

$$\lim_{\epsilon \rightarrow 0} \frac{J(u + \epsilon v) - J(u)}{\epsilon} = 0, \quad \forall v \in U.$$

We have

$$\begin{aligned} J(u + \epsilon v) &= \frac{1}{2}a(u + \epsilon v, u + \epsilon v) - l(u + \epsilon v), \\ &= \frac{1}{2}(a(u, u) + 2\epsilon a(u, v) + \epsilon^2 a(v, v)) - l(u) - \epsilon l(v), \\ &= \frac{1}{2}a(u, u) - l(u) + \epsilon(a(u, v) - l(v)) + \epsilon^2 a(v, v), \end{aligned}$$

so

$$\lim_{\epsilon \rightarrow 0} \frac{J(u + \epsilon v) - J(u)}{\epsilon} = a(u, v) - l(v), \quad \forall v \in U.$$

Hence, u solves problem (a).

4. Let

$$a(u, v) = \int_0^1 (u'v' + u'v + uv) \, dx.$$

Let V be a C^0 finite element space on $[0, 1]$ and let \mathring{V} be the subspace of functions that vanish at $x = 0$ and $x = 1$. Prove that

$$a(v, v) = \int_0^1 ((v')^2 + v^2) \, dx := \|v\|_{H^1}^2, \quad \forall v \in \mathring{V}.$$

Hence conclude that the bilinear form is coercive on \mathring{V} .

Solution: First we note that the fundamental theorem of calculus holds for C^0 finite element functions, by subdividing the integral into cells or partial cells as usual. Second we note that $v'v = (v^2)'/2$. So,

$$\int_0^1 v'v \, dx = \int_0^1 \frac{1}{2}(v^2)' \, dx = \left[\frac{1}{2}v^2 \right]_0^1 = 0,$$

by the boundary conditions. Then,

$$a(v, v) = \int_0^1 ((v')^2 + v'v + v^2) dx = \int_0^1 ((v')^2 + v^2) dx.$$

5. (a) For $f \in L^2(\Omega)$, $\sigma \in C^1(\Omega)$, find a finite element formulation of the problem

$$-\sum_{i=1}^n \frac{\partial}{\partial x_i} \left(\sigma(x) \frac{\partial u}{\partial x_i} \right) = f, \quad \frac{\partial u}{\partial n} = 0 \text{ on } \partial\Omega.$$

Solution: Let V be a C^0 finite element space defined on Ω . Multiply by test function $v \in V$ and integrate by parts, to obtain

$$\begin{aligned} \int_{\Omega} \nabla v \cdot (\sigma \nabla u) dx &= \int_{\Omega} v f dx + \int_{\partial\Omega} \underbrace{\frac{\partial u}{\partial n}}_{=0} \sigma v dx, \\ &= \int_{\Omega} v f dx. \end{aligned}$$

Hence, the finite element discretisation requires to find $u_h \in V$, such that

$$a(u_h, v) = (f, v), \quad \forall v \in V,$$

where

$$a(u, v) = \int_{\Omega} \nabla v \cdot (\sigma \nabla u) dx.$$

- (b) If there exist $0 < a < b$ such that $a < \sigma(x) < b$ for all $x \in \Omega$, show continuity and coercive for your formulation with respect to the H^1 norm.

Solution: For continuity,

$$\begin{aligned} |a(u, v)| &= \left| \sum_i \int_{\Omega} \frac{\partial u}{\partial x_i} \sigma \frac{\partial v}{\partial x_i} dx \right|, \\ &\leq b \left| \sum_i \int_{\Omega} \frac{\partial u}{\partial x_i} \frac{\partial v}{\partial x_i} dx \right|, \\ &\leq b \sum_i \left\| \frac{\partial u}{\partial x_i} \right\|_{L^2} \left\| \frac{\partial v}{\partial x_i} \right\|_{L^2}, \\ &\leq b \sum_i \left\| \frac{\partial u}{\partial x_i} \right\|_{L^2} \sum_j \left\| \frac{\partial v}{\partial x_j} \right\|_{L^2}, \\ &\leq b \left(\|u\|_{L^2}^2 + \sum_i \left\| \frac{\partial u}{\partial x_i} \right\|_{L^2}^2 \right)^{1/2} \left(\|v\|_{L^2}^2 + \sum_j \left\| \frac{\partial v}{\partial x_j} \right\|_{L^2}^2 \right)^{1/2}, \\ &= b \|u\|_{H^1} \|v\|_{H^1}. \end{aligned}$$

For coercivity (use result from lectures),

$$\begin{aligned} \|v\|_{H^1\Omega}^2 &\leq (1 + C_{\Omega}^2) |v|_{H^1(\Omega)}^2, \\ &= (1 + C_{\Omega}^2) \int_{\Omega} \nabla v \cdot \nabla v dx, \\ &= (1 + C_{\Omega}^2) \int_{\Omega} \frac{1}{\sigma} \sigma \nabla v \cdot \nabla v dx, \\ &\leq (1 + C_{\Omega}^2) \frac{1}{a} \int_{\Omega} \sigma \nabla v \cdot \nabla v dx = \frac{1}{a} (1 + C_{\Omega}^2) a(v, v). \end{aligned}$$

Hence, $a(\cdot, \cdot)$ is a symmetric bilinear form that is continuous and coercive on $H^1(\Omega)$, and hence a unique solution exists.

6. Find a C^0 finite element formulation for the Poisson equation

$$-\nabla^2 u = f, \quad u = g \text{ on } \partial\Omega,$$

for a function g which is C^2 and whose restriction to $\partial\Omega$ is in $L^2(\partial\Omega)$. Derive conditions under the discretisation has a unique solution.

Solution: Choosing a C^0 finite element space V , we define \mathring{V} as the subspace of functions vanishing on $\partial\Omega$ as above. We write $u = u^H + u^g$, where $u^H \in \mathring{V}$, and $u^g = g$ on $\partial\Omega$. Then,

$$a(u^H, v) = (f, v) - a(g, v), \quad \forall v \in \mathring{V},$$

where

$$a(u, v) = \int_{\Omega} \nabla u \cdot \nabla v \, dx.$$

We have already checked coercivity and continuity of a in lectures, so we just need to check continuity of $L(v)$ given by

$$L(v) = (f, v) - a(g, v).$$

We have

$$|L(v)| \leq \|f\|_{L^2} \|v\|_{L^2} + \|g\|_{H^1} \|v\|_{H^1} = (\|f\|_{L^2} + \|g\|_{H^1}) \|v\|_{H^1},$$

so it is continuous as required.

7. Find a C^0 finite element formulation for the Poisson equation

$$-\nabla^2 u = f, \quad u + \frac{\partial u}{\partial n} = r \text{ on } \partial\Omega,$$

for a function r defined on $\partial\Omega$. Derive conditions under which this discretisation has a unique solution.

Solution: Multiplication by test function and integration by parts gives

$$\int_{\Omega} \nabla v \cdot \nabla u \, dx - \int_{\partial\Omega} \frac{\partial u}{\partial n} v \, dx = \int_{\Omega} f v \, dx.$$

Application of the boundary condition gives

$$\int_{\Omega} \nabla v \cdot \nabla u \, dx + \int_{\partial\Omega} uv \, dx = \int_{\Omega} f v \, dx + \int_{\partial\Omega} r v \, dS.$$

Hence, we obtain a variational formulation with

$$\begin{aligned} a(u, v) &= \int_{\Omega} \nabla v \cdot \nabla u \, dx + \int_{\partial\Omega} uv \, dS, \\ L(v) &= \int_{\Omega} f v \, dx + \int_{\partial\Omega} r v \, dS. \end{aligned}$$

Continuity follows from

$$\begin{aligned} \int_{\partial\Omega} uv \, dS &\leq \|u\|_{L^2(\partial\Omega)} \|v\|_{L^2(\partial\Omega)} \\ &\leq c^2 \|u\|_{H^1} \|v\|_{H^1}, \end{aligned}$$

where $c > 0$ is the constant in the trace theorem. Hence,

$$a(u, v) \leq (1 + c^2) \|u\|_{H^1} \|v\|_{H^1}.$$

Continuity of $L(v)$ follows similarly.

To check coercivity, we initially follow the proof for Poisson with Dirichlet boundary conditions

$$\begin{aligned} \|v\|_{H^1(\Omega)}^2 &\leq \|v - \bar{v}\|_{L^2(\Omega)}^2 + \|\bar{v}\|_{L^2(\Omega)}^2, \\ &\leq C|v|_{H^1(\Omega)} + C_1 \left(\left| \int_{\partial\Omega} v \, dS \right| + \left| \int_{\partial\Omega} v - \bar{v} \, dS \right| \right), \\ &\leq C_2|v|_{H^1(\Omega)} + C_3|v|_{L^2(\partial\Omega)}, \end{aligned}$$

so there exists $C_4 > 0$ with

$$\|v\|_{H^1(\Omega)}^2 \leq C_4 a(v, v),$$

as required.
